# Ubuntu 16.04 installation tutorials

1. Before installation

First, we need to ensure that the computer has space for Ubuntu installation. Go to the computer management (right click computer). Right click the C disk and choose the compress.

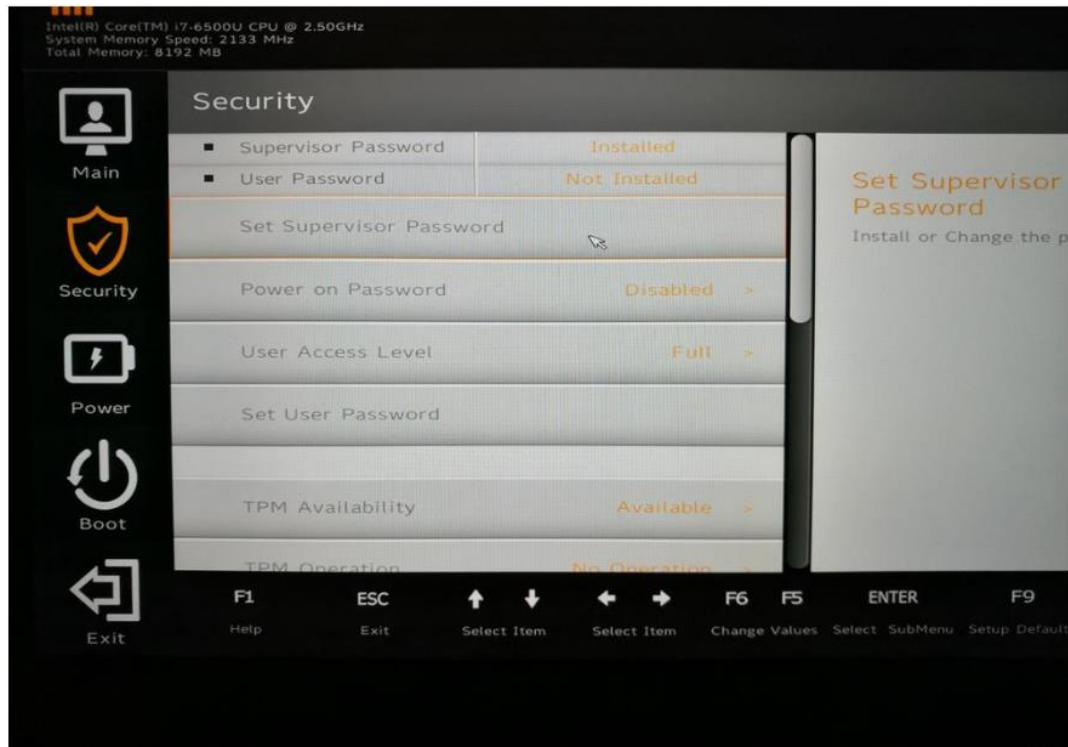

Then we need to compress minimum 20GB to 30GB for the installation.
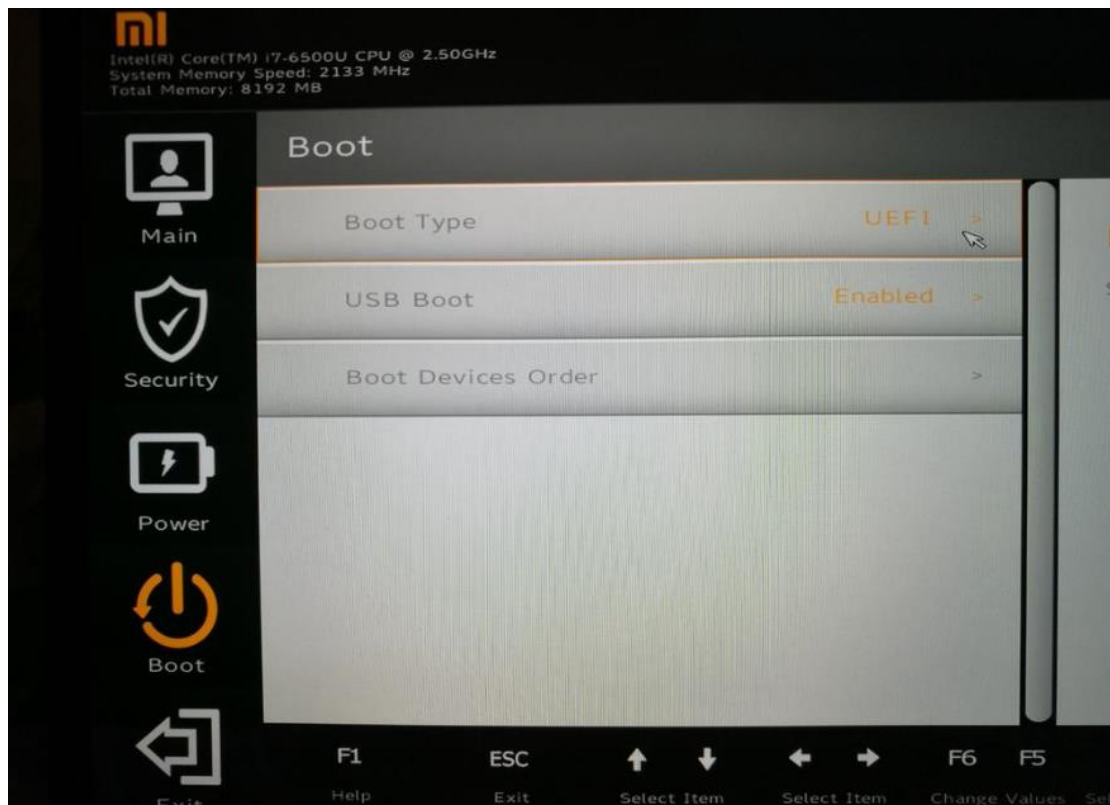

then we need to set **BIOS.**

Restart the computer, keep on pressing F2 to enter the following interface.

Then Security→ Set Supervisor password

Security → Secure Boot→Disabled

Boot→Boot type→UEFI
Then press **F10** and **Enter** to restart the computer.
Then press **F12** to enter a similar interface and choose your USB.
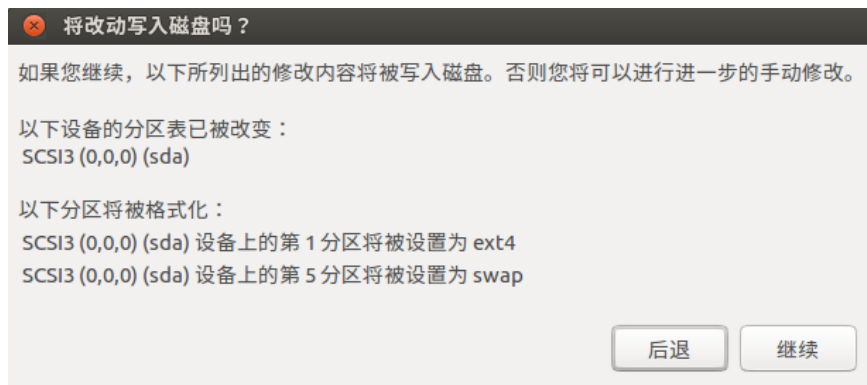

2. Ubuntu installation
Then enter the USB drive installation interface. Choose "install Ubuntu"

We can either choose Chinese or English as we can. Then choose the install Ubuntu.

Then we can choose the Wi-Fi according to your own computer situation.

Then check the second option and continue. If your network speed is fast, the first option can also be ticked.

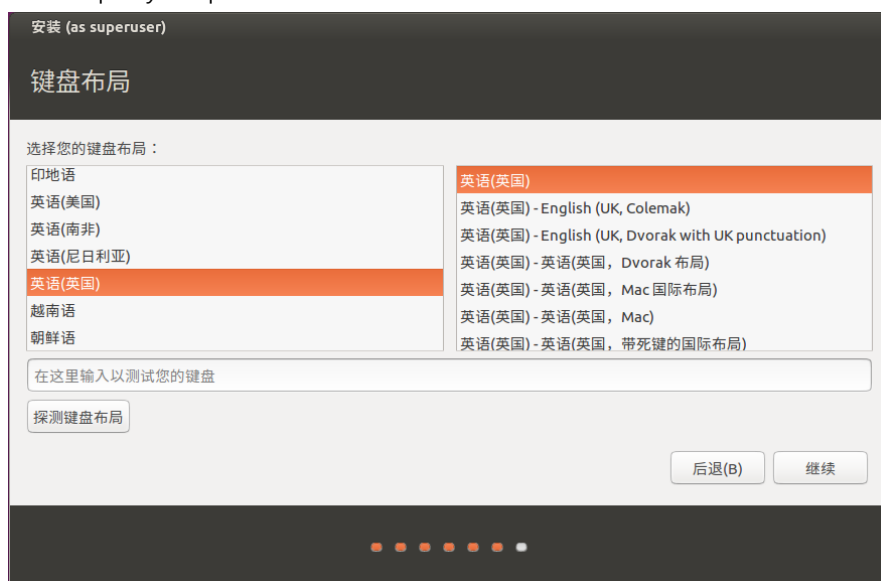

When the windows system exists, it will default to use the unallocated part of the space to install Ubuntu. Then we continue and we will see:

Choose continue.

Then input your position and continue.

We can choose either Chinese or English according to your preference.
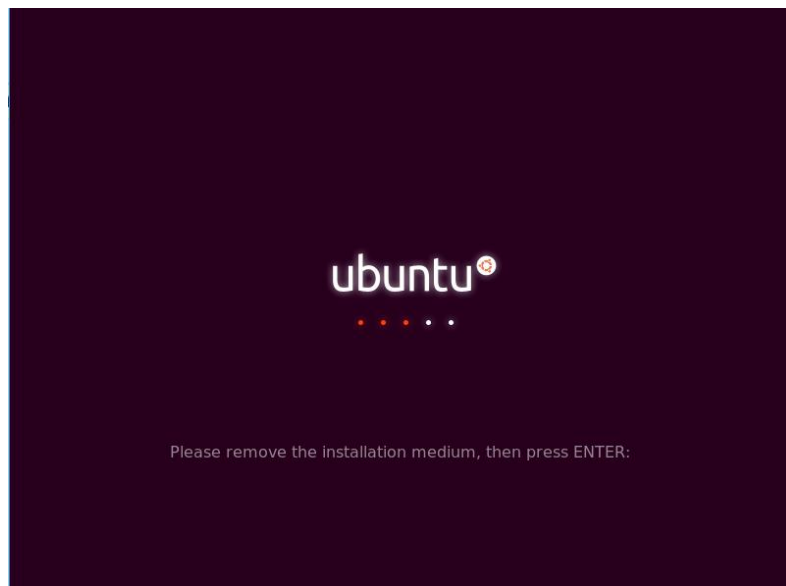

Then input your personal information:

Now wait until the installation finish.

Then restart your computer

Then remove your USB and press enter.

Please remove the installation medium, then press ENTER:

Input your password and enter the Ubuntu!
